[Health Protection](#)

Summary

- GP consultation rates for combined Influenza A and B in week 11 remained similar to week 8 at 14.4 (2010)
- Influenza A (H1N1) 2009 remains well below the Northern Ireland threshold (70/100,000 population)
- Age-specific Influenza A (H1N1) 2009 rates remain low
- Circulation of Influenza A (H1N1) 2009 increased slightly from 4.1 per 100,000 population in week 8 to 4.2 per 100,000 in week 11 (2% increase). All age-specific consultation rates remain low
- There were no influenza A (H1N1) 2009 detections reported in weeks 10 and 11
- Number of influenza B infections decreased from 6 in week 8 compared to 4 in weeks 10 and 11 (50% decrease)
- Respiratory syncytial virus (RSV) weekly detections continue to decrease
- No deaths related to influenza were reported in weeks 10 and 11 (Saturday 9 to Friday 18 March)
- The total number of patients in hospital with respiratory illness (20 March 2011) compared at 22, 12 cases, 27 patients had an underlying health problem, 2 did not, and 1 is not yet known

Key messages

- All flu-related remains low
- Influenza remains well circulating but at much lower levels
- People with underlying health problems remain at much greater risk of developing serious complications if flu
- People without underlying health problems can also be affected

The Influenza Weekly Surveillance Bulletin is produced by the PHA and covers statistics for Northern Ireland. The bulletin is currently produced every other week.
